No	Issue	Discussion	Action	Member
1	Project scenario	The project scenario consists the customer, admin and super-admin features. This includes how customers register, book and return. The admin will be able to verify users and super-admins can create more admins.	The scheme is already alright according to the client.	All members.
2	Database architecture	The database architecture includes user, car, customer, credit card, booking, booking history, location and card tables.	The team will need to make a UML diagram for the architecture. Regarding the card table, it will not be needed since it will only store customer id.	All members.
3	Demonstrating real payments	Payments can be done if the team wants to show how customers can book a car.	The team could consider doing this in the project. However, if there is not enough time, it should be put on the last sprints.	All members.
4	Car unlocking demonstration	Upon getting and returning the car, the customers could open their car with the card.	The team should consider putting this at the end of the sprint.	All members.
5	Keeping codes for each deliverable	Keeping codes might be necessary if the client wants to see the progress the team made throughout the project.	There is no need to keep each version separate because git saves the versions.	All members.
